Live Signature API will continue to work and provide what we expect will be a useful addition. Additional security controls can be added to the enterprise's existing security policy to restrict the use of the live API to authorized users. As mentioned earlier, Kaspersky Live Signature API provides a means for gathering threat intelligence. This intelligence can be used to identify and possibly block harmful applications as they are encountered in the wild, before they are able to spread their threat. In this sense,

Kaspersky Live Signature API provides some of the security provided by many of the other security controls available in the enterprise. However, it also provides an additional and new layer of security that enables it to detect new malicious applications that have not yet been identified by the enterprise. As always, we hope the reader will consider security and privacy in the workplace.
